PT   Controlling cancer -
PT   by replacing ineffective cancer suppressing gene with cloned,
PT   active gene.
PS   Claim 35; Page 86; 105pp; English.
CC   Gene is taken from human chromosome 13q14 retinoblastoma (RB) cDNA.
CC   By installing a working CSG, safe and specific treatment and
CC   prophylaxis can be given to cancer patients.

PT   Method of controlling cell cycle progression - uses purified
PT   retinoblastoma protein or fragment, for use in combination with
PT   therapeutic methods to arrest tumorigenesis
PS   Disclosure; Fig 9; 68pp; English.
CC   The sequence is that of the retinoblastoma gene which encodes the
CC   retinoblastoma (RB) protein which may be used as part of a method of
CC   controlling cell cycle progression which may be used in combination
CC   with therapeutic methods to arrest tumourigenesis in organisms. The
CC   cell cycle can be reversibly arrested in a convenient and safe
CC   manner. The protein is used in a compsn. is relatively inexpensive
CC   and readily obtainable, and shows little or no toxic effects on
CC   healthy cells. It is also compatible with other methods and devices
CC   for regulating certain physiological processes of the body, such as
CC   blood cell prodn. and gamete prodn. Fragments of the protein are
CC   soluble in low concns. of glycerol thus enhancing their value in
CC   pharmaceutical applicns.

PT   Retinoblastoma suppressor protein with N-terminal modification -
PT   inhibiting cellular proliferation, particularly cancer
PS   Disclosure; Page 121-126; 249pp; English.
CC   This sequence encodes a modified retinoblastoma tumour suppressor
CC   protein (RTSP) of the invention. The proteins can be used for inhibiting
CC   cellular proliferation, when coadministered with a p53 protein. The RTSPs
CC   can be used for treating diseases characterised by abnormal cellular
CC   proliferation, particularly cancers. The RTSPs have a broader spectrum of
CC   activity than wild type RTSPs.

PT   Retinoblastoma suppressor protein with N-terminal modification -
PT   inhibiting cellular proliferation, particularly cancer
PS   Claim 22; Page 142-147; 249pp; English.
CC   This sequence encodes a modified retinoblastoma tumour suppressor
CC   protein (RTSP) of the invention. The proteins can be used for inhibiting
CC   cellular proliferation, when coadministered with a p53 protein. The RTSPs
CC   can be used for treating diseases characterised by abnormal cellular
CC   proliferation, particularly cancers. The RTSPs have a broader spectrum of
CC   activity than wild type RTSPs.

PT   New tetracycline responsive expression vectors - used for the
PT   tightly controlled expression of genes, such as tumour suppressor
PT   genes for treating cancers
PS   Disclosure; Pages 145-150; 190pp; English.
CC   The present sequence appears in the specification, which describes a
CC   tetracycline responsive expression vector (TREV), which contains a
CC   sequence encoding a fusion protein comprising a transcriptional
CC   transactivation domain (TTD) operatively attached to a tetracycline
CC   repressor protein (TRP), the first sequence operatively positioned
CC   downstream of a promoter. The vector also contains a cloning site
CC   operatively positioned downstream of a basal promoter comprising a
CC   tetracycline operator. The TREVs can be used to produce stable cell
CC   lines in which gene expression is tightly regulated by tetracycline.
CC   They can be used for the production of proteins such as tumour
CC   suppressor proteins which can be used for treating diseases characterised
CC   by abnormal cellular proliferation, particularly cancers.

PT New fusion polypeptide of, e.g. transcription factor - used to
PT treat, e.g. hyper-proliferative disease such as cancer and
PT restenosis
PS Example 1; Fig 2A; 91pp; English.
CC This nucleotide sequence includes a coding region for retinoblastoma
CC protein RB (see W62465). A new claimed polypeptide is a fusion of:
CC (i) a transcription factor (TF) comprising a DNA binding domain,
CC and (ii) a retinoblastoma (Rb) polypeptide that includes a growth
CC suppression domain. Also new are: (1) a nucleic acid encoding the
CC fusion protein, and (2) expression vectors containing such DNA.
CC The fusion protein, particularly expressed from gene therapy
CC vectors (especially adenovirus vectors), is used to treat
CC hyperproliferative conditions, specifically cancer (particularly of

CC the bladder) or restenosis (after angioplasty), but also diabetic
CC retinopathy, thyroid hyperplasia, Grave's disease, psoriasis,
CC benign prostatic hypertrophy, Li-Fraumeni syndrome and peripheral
CC vascular disease. Tissue-specific expression of E2F-RB fusions is
CC provided. The fusion proteins are more effective in repressing
CC transcription of the E2F promoter than Rb alone and cause cell-cycle
CC arrest in a variety of cells.

PT   Inhibition of cancer cell proliferation - with retinoblastoma
PT   protein or polypeptide
PS   Example 1; Fig 2A-K; 72pp; English.
CC   The present sequence encodes a human retinoblastoma (RB) protein
CC   designated ppRB-110 or p110-RB. The protein is used in a method
CC   for inhibiting proliferation of pathologically proliferating cells
CC   lacking endogenous functional retinoblastoma protein. The method
CC   comprises contacting the cells with a polypeptide comprising a 56 kD
CC   C-terminal fragment of retinoblastoma protein. The method is useful
CC   for treating cancers, especially retinoblastoma or secondary
CC   osteosarcoma, breast cancer, small-cell lung cancer or fibrosarcoma.

PT Diagnosing the presence of defective retinoblastoma alleles -
PT comprises comparing genetic material corresponding to a normal
PT human retinoblastoma with DNA from a patient.
PS Example 2(2); Figure 7; 18pp; English.
CC A method for detecting the presence, in a tumour sample, of a protein
CC the absence of which is associated with a neoplasm, comprises
CC producing an antibody to the protein and then contacting the
CC antibody with the tumour sample. Immune complexes indicate the
CC presence of the protein in the sample. The method may be used in
CC the detection and treatment of a defective human gene related to
CC cancer, in particular retinoblastoma.

PT   Adenoviral vector with deletion of viral protein IX contains
PT   foreign gene - esp. encoding tumour suppressor protein for gene
PT   therapy of tumours, reduces contamination by wild type adenovirus
PS   Disclosure; Fig 3; 92pp; English.
CC   The sequence is that of the DNA sequence encoding a retinoblastoma
CC   tumour protein.  The gene can be used in a novel method involving a
CC   recombinant adenovirus expression vector to treat diseases
CC   associated with the ansence of the TSg or the presence of a mutated
CC   TSG, e.g. many forms of carcinoma, sickle cell anaemia or Tay-Sach's
CC   disease.
CC   See also Q90060-5.

PT Isolated human retinoblastoma gene - used to develop products for
PT analysing predisposition to retinoblastoma and for the detection and
PT treatment of retinoblastoma
PS Claim 8; Fig 5; 32pp; English.
CC This is the nucleic acid sequence of a cDNA of the normal human
CC retinoblastoma gene Rb. Absence or mutation of the Rb gene (see
CC also X04502) predisposes an individual to retinoblastoma. To

```
CC   isolate Rb cDNA, the human DNA probe pH3-8, isolated from a human
CC   chromosome 13 lambda phage library, was used in a chromosome walk
CC   to isolate and map 30 kb of genomic DNA surrounding the H3-8
CC   sequence.  Fragment p7H30.7R (ATCC 97500) was obtained, and was
CC   used as a probe to screen a cDNA library that had been constructed
CC   from an adenovirus 12-transformed human embryonic retinal cell
CC   line.  This provided clone p4.7R (ATCC 97383), which in Northern
CC   blots cross-reacted with a 4.7 kb transcript in transformed
CC   retinal cells which was not present in 4 retinoblastoma and one
CC   osteosarcoma cell samples.  Rb nucleic acids comprising the Rb
CC   gene, cDNA or a fragment of the gene, such as one of the 27 exons
CC   or 26 introns, can be used in a claimed method for detecting a
CC   deletion or point mutation in the Rb gene of a human patient.  The
CC   gene can also be used to synthesize Rb polypeptide (see Y01542) for
CC   use in the treatment of individuals determined to have a defective
CC   Rb allele.

PT   Retinoblastoma suppressor protein with N-terminal modification -
PT   inhibiting cellular proliferation, particularly cancer
PS   Claim 22; Page 166-170; 249pp; English.
CC   This sequence encodes a modified retinoblastoma tumour suppressor
CC   protein (RTSP) of the invention. The proteins can be used for inhibiting
CC   cellular proliferation, when coadministered with a p53 protein. The RTSPs
CC   can be used for treating diseases characterised by abnormal cellular
CC   proliferation, particularly cancers. The RTSPs have a broader spectrum of
CC   activity than wild type RTSPs.

PT Diagnosis of retinoblastoma - using genetic material corresp. to a normal
PT human retinoblastoma gene or a unique sub-region
PS Disclosure; p; English.
CC This gene encodes a protein, the absence of which is associated with a
CC neoplasm. It is used to produce an antibody to the protein, contacting
CC this with the tumour sample and detecting immune complexes as indication
CC of the presence in the tumour sample of the protein. Whole sequence or
CC a unique sub-region can be used. The method identifies patients lacking
CC the defective retinoblastoma (Rb) allele and thus are not at risk of
CC developing the disease.

PT   Broad spectrum tumour suppressor gene - by using retinoblastoma
PT   gene product p94RB to suppress abnormal cell proliferation in the
PT   treatment of cancer
PS   Claim 4; Fig 1; 115pp; English.
CC   Q72690 is the fragment of p94RB (a broad-spectrum tumour suppressor
CC   gene) which encodes the 94kD therapeutic retinoblastoma protein
CC   R63564. Expression of this protein in an abnormally proliferating
CC   cell causes that cell to enter a senescent-like state, terminating
CC   the proliferation. R63564 also has the advantage of engendering a low
CC   incidence of tumour suppressor gene resistance in a population of
CC   treated cells.

PT Broad spectrum tumour suppressor gene - by using retinoblastoma
PT gene product p94RB to suppress abnormal cell proliferation in the
PT treatment of cancer
PS Claim 4; Fig 1; 115pp; English.
CC Q72690 is the fragment of p94RB (a broad-spectrum tumour suppressor
CC gene) which encodes the 94kD therapeutic retinoblastoma protein
CC R63564. Expression of this protein in an abnormally proliferating
CC cell causes that cell to enter a senescent-like state, terminating
CC the proliferation. R63564 also has the advantage of engendering a low
CC incidence of tumour suppressor gene resistance in a population of
CC treated cells.

PT   Method of controlling cell cycle progression - uses purified
PT   retinoblastoma protein or fragment, for use in combination with
PT   therapeutic methods to arrest tumorigenesis
PS   Disclosure; Fig 9; 68pp; English.
CC   The sequence is that of the retinoblastoma gene which encodes the
CC   retinoblastoma (RB) protein which may be used as part of a method of
CC   controlling cell cycle progression which may be used in combination
CC   with therapeutic methods to arrest tumourigenesis in organisms. The
CC   cell cycle can be reversibly arrested in a convenient and safe
CC   manner. The protein is used in a compsn. is relatively inexpensive
CC   and readily obtainable, and shows little or no toxic effects on
CC   healthy cells. It is also compatible with other methods and devices
CC   for regulating certain physiological processes of the body, such as
CC   blood cell prodn. and gamete prodn. Fragments of the protein are
CC   soluble in low concns. of glycerol thus enhancing their value in
CC   pharmaceutical applicns.

PT   Retinoblastoma suppressor protein with N-terminal modification -
PT   inhibiting cellular proliferation, particularly cancer
PS   Claim 22; Page 150-155; 249pp; English.
CC   This sequence encodes a modified retinoblastoma tumour suppressor
CC   protein (RTSP) of the invention. The proteins can be used for inhibiting
CC   cellular proliferation, when coadministered with a p53 protein. The RTSPs
CC   can be used for treating diseases characterised by abnormal cellular
CC   proliferation, particularly cancers. The RTSPs have a broader spectrum of
CC   activity than wild type RTSPs.

PT   Retinoblastoma suppressor protein with N-terminal modification -
PT   inhibiting cellular proliferation, particularly cancer
PS   Claim 22; Page 166-170; 249pp; English.
CC   This sequence encodes a modified retinoblastoma tumour suppressor
CC   protein (RTSP) of the invention. The proteins can be used for inhibiting
CC   cellular proliferation, when coadministered with a p53 protein. The RTSPs
CC   can be used for treating diseases characterised by abnormal cellular
CC   proliferation, particularly cancers. The RTSPs have a broader spectrum of
CC   activity than wild type RTSPs.

PT New tetracycline responsive expression vectors - used for the
PT tightly controlled expression of genes, such as tumour suppressor
PT genes for treating cancers
PS Disclosure; Pages 145-150; 190pp; English.
CC The present sequence appears in the specification, which describes a
CC tetracycline responsive expression vector (TREV), which contains a
CC sequence encoding a fusion protein comprising a transcriptional
CC transactivation domain (TTD) operatively attached to a tetracycline
CC repressor protein (TRP), the first sequence operatively positioned
CC downstream of a promoter. The vector also contains a cloning site
CC operatively positioned downstream of a basal promoter comprising a
CC tetracycline operator. The TREVs can be used to produce stable cell
CC lines in which gene expression is tightly regulated by tetracycline.
CC They can be used for the production of proteins such as tumour
CC suppressor proteins which can be used for treating diseases characterised
CC by abnormal cellular proliferation, particularly cancers.

PT   New fusion polypeptide of, e.g. transcription factor  - used to
PT   treat, e.g. hyper-proliferative disease such as cancer and
PT   restenosis
PS   Example 1; Fig 2A; 91pp; English.
CC   This nucleotide sequence includes a coding region for retinoblastoma
CC   protein RB (see W62465).  A new claimed polypeptide is a fusion of:
CC   (i) a transcription factor (TF) comprising a DNA binding domain,
CC   and (ii) a retinoblastoma (Rb) polypeptide that includes a growth
CC   suppression domain.  Also new are: (1) a nucleic acid encoding the
CC   fusion protein, and (2) expression vectors containing such DNA.
CC   The fusion protein, particularly expressed from gene therapy
CC   vectors (especially adenovirus vectors), is used to treat
CC   hyperproliferative conditions, specifically cancer (particularly of
CC   the bladder) or restenosis (after angioplasty), but also diabetic
CC   retinopathy, thyroid hyperplasia, Grave's disease, psoriasis,
CC   benign prostatic hypertrophy, Li-Fraumeni syndrome and peripheral
CC   vascular disease.  Tissue-specific expression of E2F-RB fusions is
CC   provided.  The fusion proteins are more effective in repressing
CC   transcription of the E2F promoter than Rb alone and cause cell-cycle
CC   arrest in a variety of cells.

PT   Inhibition of cancer cell proliferation - with retinoblastoma
PT   protein or polypeptide
PS   Example 1; Fig 2A-K; 72pp; English.
CC   The present sequence encodes a human retinoblastoma (RB) protein
CC   designated ppRB-110 or p110-RB. The protein is used in a method
CC   for inhibiting proliferation of pathologically proliferating cells
CC   lacking endogenous functional retinoblastoma protein. The method
CC   comprises contacting the cells with a polypeptide comprising a 56 kD
CC   C-terminal fragment of retinoblastoma protein. The method is useful
CC   for treating cancers, especially retinoblastoma or secondary
CC   osteosarcoma, breast cancer, small-cell lung cancer or fibrosarcoma.

PT   Retinoblastoma suppressor protein with N-terminal modification -
PT   inhibiting cellular proliferation, particularly cancer
PS   Claim 22; Page 226-230; 249pp; English.
CC   This sequence encodes a modified retinoblastoma tumour suppressor
CC   protein (RTSP) of the invention. The proteins can be used for inhibiting
CC   cellular proliferation, when coadministered with a p53 protein. The RTSPs
CC   can be used for treating diseases characterised by abnormal cellular
CC   proliferation, particularly cancers. The RTSPs have a broader spectrum of
CC   activity than wild type RTSPs.

PT New tetracycline responsive expression vectors - used for the
PT tightly controlled expression of genes, such as tumour suppressor
PT genes for treating cancers
PS Disclosure; Pages 153-157; 190pp; English.
CC The present sequence appears in the specification, which describes a
CC tetracycline responsive expression vector (TREV), which contains a
CC sequence encoding a fusion protein comprising a transcriptional
CC transactivation domain (TTD) operatively attached to a tetracycline
CC repressor protein (TRP), the first sequence operatively positioned
CC downstream of a promoter. The vector also contains a cloning site
CC operatively positioned downstream of a basal promoter comprising a
CC tetracycline operator. The TREVs can be used to produce stable cell
CC lines in which gene expression is tightly regulated by tetracycline.
CC They can be used for the production of proteins such as tumour
CC suppressor proteins which can be used for treating diseases characterised
CC by abnormal cellular proliferation, particularly cancers.

PT   Broad spectrum tumour suppressor gene - by using retinoblastoma
PT   gene product p94RB to suppress abnormal cell proliferation in the
PT   treatment of cancer
PS   Claim 4; Fig 1; 115pp; English.
CC   Q72690 is the fragment of p94RB (a broad-spectrum tumour suppressor
CC   gene) which encodes the 94kD therapeutic retinoblastoma protein
CC   R63564. Expression of this protein in an abnormally proliferating
CC   cell causes that cell to enter a senescent-like state, terminating
CC   the proliferation. R63564 also has the advantage of engendering a low
CC   incidence of tumour suppressor gene resistance in a population of
CC   treated cells.

PT Method of controlling cell cycle progression - uses purified
PT retinoblastoma protein or fragment, for use in combination with
PT therapeutic methods to arrest tumorigenesis
PS Disclosure; Fig 9; 68pp; English.
CC The sequence is that of the retinoblastoma gene which encodes the
CC retinoblastoma (RB) protein which may be used as part of a method of
CC controlling cell cycle progression which may be used in combination
CC with therapeutic methods to arrest tumourigenesis in organisms. The
CC cell cycle can be reversibly arrested in a convenient and safe
CC manner. The protein is used in a compsn. is relatively inexpensive
CC and readily obtainable, and shows little or no toxic effects on
CC healthy cells. It is also compatible with other methods and devices
CC for regulating certain physiological processes of the body, such as
CC blood cell prodn. and gamete prodn. Fragments of the protein are
CC soluble in low concns. of glycerol thus enhancing their value in
CC pharmaceutical applicns.

PT Retinoblastoma suppressor protein with N-terminal modification -
PT inhibiting cellular proliferation, particularly cancer
PS Disclosure; Page 121-126; 249pp; English.
CC This sequence encodes a modified retinoblastoma tumour suppressor
CC protein (RTSP) of the invention. The proteins can be used for inhibiting
CC cellular proliferation, when coadministered with a p53 protein. The RTSPs
CC can be used for treating diseases characterised by abnormal cellular
CC proliferation, particularly cancers. The RTSPs have a broader spectrum of
CC activity than wild type RTSPs.

PT Retinoblastoma suppressor protein with N-terminal modification -
PT inhibiting cellular proliferation, particularly cancer
PS Claim 22; Page 142-147; 249pp; English.
CC This sequence encodes a modified retinoblastoma tumour suppressor
CC protein (RTSP) of the invention. The proteins can be used for inhibiting
CC cellular proliferation, when coadministered with a p53 protein. The RTSPs
CC can be used for treating diseases characterised by abnormal cellular
CC proliferation, particularly cancers. The RTSPs have a broader spectrum of
CC activity than wild type RTSPs.

PT Retinoblastoma suppressor protein with N-terminal modification -

PT inhibiting cellular proliferation, particularly cancer
PS Claim 22; Page 158-162; 249pp; English.
CC This sequence encodes a modified retinoblastoma tumour suppressor
CC protein (RTSP) of the invention. The proteins can be used for inhibiting
CC cellular proliferation, when coadministered with a p53 protein. The RTSPs
CC can be used for treating diseases characterised by abnormal cellular
CC proliferation, particularly cancers. The RTSPs have a broader spectrum of
CC activity than wild type RTSPs.

PT   Retinoblastoma suppressor protein with N-terminal modification -
PT   inhibiting cellular proliferation, particularly cancer
PS   Claim 22; Page 166-170; 249pp; English.
CC   This sequence encodes a modified retinoblastoma tumour suppressor
CC   protein (RTSP) of the invention. The proteins can be used for inhibiting
CC   cellular proliferation, when coadministered with a p53 protein. The RTSPs
CC   can be used for treating diseases characterised by abnormal cellular
CC   proliferation, particularly cancers. The RTSPs have a broader spectrum of
CC   activity than wild type RTSPs.

PT New tetracycline responsive expression vectors - used for the
PT tightly controlled expression of genes, such as tumour suppressor
PT genes for treating cancers
PS Disclosure; Pages 145-150; 190pp; English.
CC The present sequence appears in the specification, which describes a
CC tetracycline responsive expression vector (TREV), which contains a
CC sequence encoding a fusion protein comprising a transcriptional
CC transactivation domain (TTD) operatively attached to a tetracycline
CC repressor protein (TRP), the first sequence operatively positioned
CC downstream of a promoter. The vector also contains a cloning site
CC operatively positioned downstream of a basal promoter comprising a
CC tetracycline operator. The TREVs can be used to produce stable cell
CC lines in which gene expression is tightly regulated by tetracycline.
CC They can be used for the production of proteins such as tumour
CC suppressor proteins which can be used for treating diseases characterised
CC by abnormal cellular proliferation, particularly cancers.

PT   New fusion polypeptide of, e.g. transcription factor  - used to
PT   treat, e.g. hyper-proliferative disease such as cancer and
PT   restenosis
PS   Example 1; Fig 2A; 91pp; English.
CC   This nucleotide sequence includes a coding region for retinoblastoma
CC   protein RB (see W62465).  A new claimed polypeptide is a fusion of:
CC   (i) a transcription factor (TF) comprising a DNA binding domain,
CC   and (ii) a retinoblastoma (Rb) polypeptide that includes a growth
CC   suppression domain.  Also new are: (1) a nucleic acid encoding the
CC   fusion protein, and (2) expression vectors containing such DNA.
CC   The fusion protein, particularly expressed from gene therapy
CC   vectors (especially adenovirus vectors), is used to treat
CC   hyperproliferative conditions, specifically cancer (particularly of
CC   the bladder) or restenosis (after angioplasty), but also diabetic
CC   retinopathy, thyroid hyperplasia, Grave's disease, psoriasis,
CC   benign prostatic hypertrophy, Li-Fraumeni syndrome and peripheral
CC   vascular disease.  Tissue-specific expression of E2F-RB fusions is
CC   provided.  The fusion proteins are more effective in repressing
CC   transcription of the E2F promoter than Rb alone and cause cell-cycle
CC   arrest in a variety of cells.

PT   Inhibition of cancer cell proliferation - with retinoblastoma
PT   protein or polypeptide
PS   Example 1; Fig 2A-K; 72pp; English.
CC   The present sequence encodes a human retinoblastoma (RB) protein
CC   designated ppRB-110 or p110-RB. The protein is used in a method
CC   for inhibiting proliferation of pathologically proliferating cells
CC   lacking endogenous functional retinoblastoma protein. The method
CC   comprises contacting the cells with a polypeptide comprising a 56 kD
CC   C-terminal fragment of retinoblastoma protein. The method is useful
CC   for treating cancers, especially retinoblastoma or secondary
CC   osteosarcoma, breast cancer, small-cell lung cancer or fibrosarcoma.

PT   Retinoblastoma suppressor protein with N-terminal modification -
PT   inhibiting cellular proliferation, particularly cancer
PS   Claim 22; Page 226-230; 249pp; English.
CC   This sequence encodes a modified retinoblastoma tumour suppressor
CC   protein (RTSP) of the invention. The proteins can be used for inhibiting
CC   cellular proliferation, when coadministered with a p53 protein. The RTSPs
CC   can be used for treating diseases characterised by abnormal cellular
CC   proliferation, particularly cancers. The RTSPs have a broader spectrum of
CC   activity than wild type RTSPs.

PT New tetracycline responsive expression vectors - used for the
PT tightly controlled expression of genes, such as tumour suppressor
PT genes for treating cancers
PS Disclosure; Pages 153-157; 190pp; English.
CC The present sequence appears in the specification, which describes a
CC tetracycline responsive expression vector (TREV), which contains a
CC sequence encoding a fusion protein comprising a transcriptional
CC transactivation domain (TTD) operatively attached to a tetracycline
CC repressor protein (TRP), the first sequence operatively positioned
CC downstream of a promoter. The vector also contains a cloning site
CC operatively positioned downstream of a basal promoter comprising a
CC tetracycline operator. The TREVs can be used to produce stable cell
CC lines in which gene expression is tightly regulated by tetracycline.
CC They can be used for the production of proteins such as tumour
CC suppressor proteins which can be used for treating diseases characterised
CC by abnormal cellular proliferation, particularly cancers.

PT Retinoblastoma suppressor protein with N-terminal modification -
PT inhibiting cellular proliferation, particularly cancer
PS Claim 22; Page 196-200; 249pp; English.
CC This sequence encodes a modified retinoblastoma tumour suppressor
CC protein (RTSP) of the invention. The proteins can be used for inhibiting
CC cellular proliferation, when coadministered with a p53 protein. The RTSPs
CC can be used for treating diseases characterised by abnormal cellular
CC proliferation, particularly cancers. The RTSPs have a broader spectrum of
CC activity than wild type RTSPs.

PT   Method of controlling cell cycle progression - uses purified
PT   retinoblastoma protein or fragment, for use in combination with
PT   therapeutic methods to arrest tumorigenesis
PS   Disclosure; Fig 9; 68pp; English.
CC   The sequence is that of the retinoblastoma gene which encodes the
CC   retinoblastoma (RB) protein which may be used as part of a method of
CC   controlling cell cycle progression which may be used in combination
CC   with therapeutic methods to arrest tumourigenesis in organisms. The
CC   cell cycle can be reversibly arrested in a convenient and safe
CC   manner. The protein is used in a compsn. is relatively inexpensive
CC   and readily obtainable, and shows little or no toxic effects on
CC   healthy cells. It is also compatible with other methods and devices
CC   for regulating certain physiological processes of the body, such as
CC   blood cell prodn. and gamete prodn. Fragments of the protein are
CC   soluble in low concns. of glycerol thus enhancing their value in
CC   pharmaceutical applicns.

PT Broad spectrum tumour suppressor gene - by using retinoblastoma

PT gene product p94RB to suppress abnormal cell proliferation in the

PT treatment of cancer

PS Claim 4; Fig 1; 115pp; English.

CC Q72690 is the fragment of p94RB (a broad-spectrum tumour suppressor

CC gene) which encodes the 94kD therapeutic retinoblastoma protein

CC R63564. Expression of this protein in an abnormally proliferating

CC cell causes that cell to enter a senescent-like state, terminating

CC the proliferation. R63564 also has the advantage of engendering a low

CC incidence of tumour suppressor gene resistance in a population of

CC treated cells.

PT   Retinoblastoma suppressor protein with N-terminal modification -
PT   inhibiting cellular proliferation, particularly cancer
PS   Claim 22; Page 142-147; 249pp; English.
CC   This sequence encodes a modified retinoblastoma tumour suppressor
CC   protein (RTSP) of the invention. The proteins can be used for inhibiting
CC   cellular proliferation, when coadministered with a p53 protein. The RTSPs
CC   can be used for treating diseases characterised by abnormal cellular
CC   proliferation, particularly cancers. The RTSPs have a broader spectrum of
CC   activity than wild type RTSPs.

PT   Retinoblastoma suppressor protein with N-terminal modification -
PT   inhibiting cellular proliferation, particularly cancer
PS   Claim 22; Page 150-155; 249pp; English.
CC   This sequence encodes a modified retinoblastoma tumour suppressor
CC   protein (RTSP) of the invention. The proteins can be used for inhibiting
CC   cellular proliferation, when coadministered with a p53 protein. The RTSPs
CC   can be used for treating diseases characterised by abnormal cellular
CC   proliferation, particularly cancers. The RTSPs have a broader spectrum of
CC   activity than wild type RTSPs.

PT   Retinoblastoma suppressor protein with N-terminal modification -
PT   inhibiting cellular proliferation, particularly cancer
PS   Claim 22; Page 180-184; 249pp; English.
CC   This sequence encodes a modified retinoblastoma tumour suppressor
CC   protein (RTSP) of the invention. The proteins can be used for inhibiting
CC   cellular proliferation, when coadministered with a p53 protein. The RTSPs
CC   can be used for treating diseases characterised by abnormal cellular
CC   proliferation, particularly cancers. The RTSPs have a broader spectrum of
CC   activity than wild type RTSPs.

PT New tetracycline responsive expression vectors - used for the
PT tightly controlled expression of genes, such as tumour suppressor
PT genes for treating cancers
PS Disclosure; Pages 145-150; 190pp; English.
CC The present sequence appears in the specification, which describes a
CC tetracycline responsive expression vector (TREV), which contains a
CC sequence encoding a fusion protein comprising a transcriptional
CC transactivation domain (TTD) operatively attached to a tetracycline
CC repressor protein (TRP), the first sequence operatively positioned
CC downstream of a promoter. The vector also contains a cloning site
CC operatively positioned downstream of a basal promoter comprising a
CC tetracycline operator. The TREVs can be used to produce stable cell
CC lines in which gene expression is tightly regulated by tetracycline.
CC They can be used for the production of proteins such as tumour
CC suppressor proteins which can be used for treating diseases characterised
CC by abnormal cellular proliferation, particularly cancers.

PT   New tetracycline responsive expression vectors - used for the
PT   tightly controlled expression of genes, such as tumour suppressor
PT   genes for treating cancers
PS   Disclosure; Pages 153-157; 190pp; English.
CC   The present sequence appears in the specification, which describes a
CC   tetracycline responsive expression vector (TREV), which contains a
CC   sequence encoding a fusion protein comprising a transcriptional
CC   transactivation domain (TTD) operatively attached to a tetracycline
CC   repressor protein (TRP), the first sequence operatively positioned
CC   downstream of a promoter. The vector also contains a cloning site
CC   operatively positioned downstream of a basal promoter comprising a
CC   tetracycline operator. The TREVs can be used to produce stable cell
CC   lines in which gene expression is tightly regulated by tetracycline.
CC   They can be used for the production of proteins such as tumour
CC   suppressor proteins which can be used for treating diseases characterised
CC   by abnormal cellular proliferation, particularly cancers.

PT Retinoblastoma suppressor protein with N-terminal modification -
PT inhibiting cellular proliferation, particularly cancer
PS Claim 22; Page 203-207; 249pp; English.
CC This sequence encodes a modified retinoblastoma tumour suppressor
CC protein (RTSP) of the invention. The proteins can be used for inhibiting
CC cellular proliferation, when coadministered with a p53 protein. The RTSPs
CC can be used for treating diseases characterised by abnormal cellular
CC proliferation, particularly cancers. The RTSPs have a broader spectrum of
CC activity than wild type RTSPs.

PT   Method of controlling cell cycle progression - uses purified
PT   retinoblastoma protein or fragment, for use in combination with
PT   therapeutic methods to arrest tumorigenesis
PS   Disclosure; Fig 9; 68pp; English.
CC   The sequence is that of the retinoblastoma gene which encodes the
CC   retinoblastoma (RB) protein which may be used as part of a method of
CC   controlling cell cycle progression which may be used in combination
CC   with therapeutic methods to arrest tumourigenesis in organisms. The
CC   cell cycle can be reversibly arrested in a convenient and safe
CC   manner. The protein is used in a compsn. is relatively inexpensive
CC   and readily obtainable, and shows little or no toxic effects on
CC   healthy cells. It is also compatible with other methods and devices
CC   for regulating certain physiological processes of the body, such as
CC   blood cell prodn. and gamete prodn. Fragments of the protein are
CC   soluble in low concns. of glycerol thus enhancing their value in
CC   pharmaceutical applicns.

PT   Broad spectrum tumour suppressor gene - by using retinoblastoma
PT   gene product p94RB to suppress abnormal cell proliferation in the
PT   treatment of cancer
PS   Claim 4; Fig 1; 115pp; English.
CC   Q72690 is the fragment of p94RB (a broad-spectrum tumour suppressor
CC   gene) which encodes the 94kD therapeutic retinoblastoma protein
CC   R63564. Expression of this protein in an abnormally proliferating
CC   cell causes that cell to enter a senescent-like state, terminating
CC   the proliferation. R63564 also has the advantage of engendering a low
CC   incidence of tumour suppressor gene resistance in a population of
CC   treated cells.

PT Retinoblastoma suppressor protein with N-terminal modification -
PT inhibiting cellular proliferation, particularly cancer
PS Claim 22; Page 188-192; 249pp; English.
CC This sequence encodes a modified retinoblastoma tumour suppressor
CC protein (RTSP) of the invention. The proteins can be used for inhibiting
CC cellular proliferation, when coadministered with a p53 protein. The RTSPs
CC can be used for treating diseases characterised by abnormal cellular
CC proliferation, particularly cancers. The RTSPs have a broader spectrum of
CC activity than wild type RTSPs.

PT   Retinoblastoma suppressor protein with N-terminal modification -
PT   inhibiting cellular proliferation, particularly cancer
PS   Claim 22; Page 226-230; 249pp; English.
CC   This sequence encodes a modified retinoblastoma tumour suppressor
CC   protein (RTSP) of the invention. The proteins can be used for inhibiting
CC   cellular proliferation, when coadministered with a p53 protein. The RTSPs
CC   can be used for treating diseases characterised by abnormal cellular
CC   proliferation, particularly cancers. The RTSPs have a broader spectrum of
CC   activity than wild type RTSPs.

PT   Retinoblastoma suppressor protein with N-terminal modification -
PT   inhibiting cellular proliferation, particularly cancer
PS   Claim 22; Page 142-147; 249pp; English.
CC   This sequence encodes a modified retinoblastoma tumour suppressor
CC   protein (RTSP) of the invention. The proteins can be used for inhibiting
CC   cellular proliferation, when coadministered with a p53 protein. The RTSPs
CC   can be used for treating diseases characterised by abnormal cellular
CC   proliferation, particularly cancers. The RTSPs have a broader spectrum of
CC   activity than wild type RTSPs.

PT   Retinoblastoma suppressor protein with N-terminal modification -
PT   inhibiting cellular proliferation, particularly cancer
PS   Claim 22; Page 158-162; 249pp; English.
CC   This sequence encodes a modified retinoblastoma tumour suppressor
CC   protein (RTSP) of the invention. The proteins can be used for inhibiting
CC   cellular proliferation, when coadministered with a p53 protein. The RTSPs
CC   can be used for treating diseases characterised by abnormal cellular
CC   proliferation, particularly cancers. The RTSPs have a broader spectrum of
CC   activity than wild type RTSPs.

PT   Retinoblastoma suppressor protein with N-terminal modification -
PT   inhibiting cellular proliferation, particularly cancer
PS   Claim 22; Page 173-177; 249pp; English.
CC   This sequence encodes a modified retinoblastoma tumour suppressor
CC   protein (RTSP) of the invention. The proteins can be used for inhibiting
CC   cellular proliferation, when coadministered with a p53 protein. The RTSPs
CC   can be used for treating diseases characterised by abnormal cellular
CC   proliferation, particularly cancers. The RTSPs have a broader spectrum of
CC   activity than wild type RTSPs.

PT   New tetracycline responsive expression vectors - used for the
PT   tightly controlled expression of genes, such as tumour suppressor
PT   genes for treating cancers
```

PS Disclosure; Pages 145-150; 190pp; English.
CC The present sequence appears in the specification, which describes a
CC tetracycline responsive expression vector (TREV), which contains a
CC sequence encoding a fusion protein comprising a transcriptional
CC transactivation domain (TTD) operatively attached to a tetracycline
CC repressor protein (TRP), the first sequence operatively positioned
CC downstream of a promoter. The vector also contains a cloning site
CC operatively positioned downstream of a basal promoter comprising a
CC tetracycline operator. The TREVs can be used to produce stable cell
CC lines in which gene expression is tightly regulated by tetracycline.
CC They can be used for the production of proteins such as tumour
CC suppressor proteins which can be used for treating diseases characterised
CC by abnormal cellular proliferation, particularly cancers.

PT Retinoblastoma suppressor protein with N-terminal modification -
PT inhibiting cellular proliferation, particularly cancer
PS Claim 22; Page 210-215; 249pp; English.
CC This sequence encodes a modified retinoblastoma tumour suppressor
CC protein (RTSP) of the invention. The proteins can be used for inhibiting
CC cellular proliferation, when coadministered with a p53 protein. The RTSPs
CC can be used for treating diseases characterised by abnormal cellular
CC proliferation, particularly cancers. The RTSPs have a broader spectrum of
CC activity than wild type RTSPs.

PT   Method of controlling cell cycle progression - uses purified
PT   retinoblastoma protein or fragment, for use in combination with
PT   therapeutic methods to arrest tumorigenesis
PS   Disclosure; Fig 9; 68pp; English.
CC   The sequence is that of the retinoblastoma gene which encodes the
CC   retinoblastoma (RB) protein which may be used as part of a method of
CC   controlling cell cycle progression which may be used in combination
CC   with therapeutic methods to arrest tumourigenesis in organisms. The
CC   cell cycle can be reversibly arrested in a convenient and safe
CC   manner. The protein is used in a compsn. is relatively inexpensive
CC   and readily obtainable, and shows little or no toxic effects on
CC   healthy cells. It is also compatible with other methods and devices
CC   for regulating certain physiological processes of the body, such as
CC   blood cell prodn. and gamete prodn. Fragments of the protein are
CC   soluble in low concns. of glycerol thus enhancing their value in
CC   pharmaceutical applicns.

PT Broad spectrum tumour suppressor gene - by using retinoblastoma
PT gene product p94RB to suppress abnormal cell proliferation in the
PT treatment of cancer
PS Claim 4; Fig 1; 115pp; English.
CC Q72690 is the fragment of p94RB (a broad-spectrum tumour suppressor
CC gene) which encodes the 94kD therapeutic retinoblastoma protein
CC R63564. Expression of this protein in an abnormally proliferating
CC cell causes that cell to enter a senescent-like state, terminating
CC the proliferation. R63564 also has the advantage of engendering a low
CC incidence of tumour suppressor gene resistance in a population of
CC treated cells.

PT Retinoblastoma suppressor protein with N-terminal modification -
PT inhibiting cellular proliferation, particularly cancer
PS Claim 22; Page 188-192; 249pp; English.
CC This sequence encodes a modified retinoblastoma tumour suppressor
CC protein (RTSP) of the invention. The proteins can be used for inhibiting
CC cellular proliferation, when coadministered with a p53 protein. The RTSPs
CC can be used for treating diseases characterised by abnormal cellular
CC proliferation, particularly cancers. The RTSPs have a broader spectrum of
CC activity than wild type RTSPs.

PT   Retinoblastoma suppressor protein with N-terminal modification -
PT   inhibiting cellular proliferation, particularly cancer
PS   Claim 22; Page 226-230; 249pp; English.
CC   This sequence encodes a modified retinoblastoma tumour suppressor
CC   protein (RTSP) of the invention. The proteins can be used for inhibiting
CC   cellular proliferation when coadministered with a p53 protein. The RTSPs
CC   can be used for treating diseases characterised by abnormal cellular
CC   proliferation, particularly cancers. The RTSPs have a broader spectrum of
CC   activity than wild type RTSPs.

PT    Retinoblastoma suppressor protein with N-terminal modification -
PT    inhibiting cellular proliferation, particularly cancer
PS    Claim 22; Page 150-155; 249pp; English.
CC    This sequence encodes a modified retinoblastoma tumour suppressor
CC    protein (RTSP) of the invention. The proteins can be used for inhibiting
CC    cellular proliferation, when coadministered with a p53 protein. The RTSPs
CC    can be used for treating diseases characterised by abnormal cellular
CC    proliferation, particularly cancers. The RTSPs have a broader spectrum of
CC    activity than wild type RTSPs.

Number of hits that pass the threshold : 623170

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

PT Retinoblastoma suppressor protein with N-terminal modification -
PT inhibiting cellular proliferation, particularly cancer
PS Claim 22; Page 218-222; 249pp; English.
CC This sequence encodes a modified retinoblastoma tumour suppressor
CC protein (RTSP) of the invention. The proteins can be used for inhibiting
CC cellular proliferation, when coadministered with a p53 protein. The RTSPs
CC can be used for treating diseases characterised by abnormal cellular
CC proliferation, particularly cancers. The RTSPs have a broader spectrum of
CC activity than wild type RTSPs.

PT   Method of controlling cell cycle progression - uses purified
PT   retinoblastoma protein or fragment, for use in combination with
PT   therapeutic methods to arrest tumorigenesis
PS   Disclosure; Fig 9; 68pp; English.
CC   The sequence is that of the retinoblastoma gene which encodes the
CC   retinoblastoma (RB) protein which may be used as part of a method of
CC   controlling cell cycle progression which may be used in combination
CC   with therapeutic methods to arrest tumourigenesis in organisms. The
CC   cell cycle can be reversibly arrested in a convenient and safe
CC   manner. The protein is used in a compsn. is relatively inexpensive
CC   and readily obtainable, and shows little or no toxic effects on
CC   healthy cells. It is also compatible with other methods and devices
CC   for regulating certain physiological processes of the body, such as
CC   blood cell prodn. and gamete prodn. Fragments of the protein are
CC   soluble in low concns. of glycerol thus enhancing their value in
CC   pharmaceutical applicns.

PT   Broad spectrum tumour suppressor gene - by using retinoblastoma
PT   gene product p94RB to suppress abnormal cell proliferation in the
PT   treatment of cancer
PS   Claim 4; Fig 1; 115pp; English.
CC   Q72690 is the fragment of p94RB (a broad-spectrum tumour suppressor
CC   gene) which encodes the 94kD therapeutic retinoblastoma protein
CC   R63564. Expression of this protein in an abnormally proliferating
CC   cell causes that cell to enter a senescent-like state, terminating
CC   the proliferation. R63564 also has the advantage of engendering a low
CC   incidence of tumour suppressor gene resistance in a population of
CC   treated cells.

PT   Retinoblastoma suppressor protein with N-terminal modification -
PT   inhibiting cellular proliferation, particularly cancer
PS   Claim 22; Page 188-192; 249pp; English.
CC   This sequence encodes a modified retinoblastoma tumour suppressor
CC   protein (RTSP) of the invention. The proteins can be used for inhibiting
CC   cellular proliferation; when coadministered with a p53 protein. The RTSPs
CC   can be used for treating diseases characterised by abnormal cellular
CC   proliferation, particularly cancers. The RTSPs have a broader spectrum of
CC   activity than wild type RTSPs.

PT Retinoblastoma suppressor protein with N-terminal modification -
PT inhibiting cellular proliferation, particularly cancer
PS Claim 22; Page 196-200; 249pp; English.
CC This sequence encodes a modified retinoblastoma tumour suppressor
CC protein (RTSP) of the invention. The proteins can be used for inhibiting
CC cellular proliferation, when coadministered with a p53 protein. The RTSPs
CC can be used for treating diseases characterised by abnormal cellular
CC proliferation, particularly cancers. The RTSPs have a broader spectrum of
CC activity than wild type RTSPs.

PT   Retinoblastoma suppressor protein with N-terminal modification -
PT   inhibiting cellular proliferation, particularly cancer
PS   Claim 22; Page 226-230; 249pp; English.
CC   This sequence encodes a modified retinoblastoma tumour suppressor
CC   protein (RTSP) of the invention. The proteins can be used for inhibiting
CC   cellular proliferation, when coadministered with a p53 protein. The RTSPs
CC   can be used for treating diseases characterised by abnormal cellular
CC   proliferation, particularly cancers. The RTSPs have a broader spectrum of
CC   activity than wild type RTSPs.

PT   Retinoblastoma suppressor protein with N-terminal modification -
PT   inhibiting cellular proliferation, particularly cancer
PS   Claim 22; Page 142-147; 249pp; English.
CC   This sequence encodes a modified retinoblastoma tumour suppressor
CC   protein (RTSP) of the invention. The proteins can be used for inhibiting
CC   cellular proliferation, when coadministered with a p53 protein. The RTSPs
CC   can be used for treating diseases characterised by abnormal cellular
CC   proliferation, particularly cancers. The RTSPs have a broader spectrum of
CC   activity than wild type RTSPs.

PT Retinoblastoma suppressor protein with N-terminal modification -
PT inhibiting cellular proliferation, particularly cancer
PS Claim 22; Page 158-162; 249pp; English.
CC This sequence encodes a modified retinoblastoma tumour suppressor
CC protein (RTSP) of the invention. The proteins can be used for inhibiting
CC cellular proliferation, when coadministered with a p53 protein. The RTSPs
CC can be used for treating diseases characterised by abnormal cellular
CC proliferation, particularly cancers. The RTSPs have a broader spectrum of
CC activity than wild type RTSPs.

PT   Retinoblastoma suppressor protein with N-terminal modification -
PT   inhibiting cellular proliferation, particularly cancer
PS   Claim 22; Page 173-177; 249pp; English.
CC   This sequence encodes a modified retinoblastoma tumour suppressor
CC   protein (RTSP) of the invention. The proteins can be used for inhibiting
CC   cellular proliferation, when coadministered with a p53 protein. The RTSPs
CC   can be used for treating diseases characterised by abnormal cellular
CC   proliferation, particularly cancers. The RTSPs have a broader spectrum of
CC   activity than wild type RTSPs.

PT   Retinoblastoma suppressor protein with N-terminal modification -
PT   inhibiting cellular proliferation, particularly cancer
PS   Disclosure; Page 121-126; 249pp; English.
CC   This sequence encodes a modified retinoblastoma tumour suppressor
CC   protein (RTSP) of the invention. The proteins can be used for inhibiting
CC   cellular proliferation, when coadministered with a p53 protein. The RTSPs
CC   can be used for treating diseases characterised by abnormal cellular
CC   proliferation, particularly cancers. The RTSPs have a broader spectrum of
CC   activity than wild type RTSPs.

PT New tetracycline responsive expression vectors - used for the
PT tightly controlled expression of genes, such as tumour suppressor
PT genes for treating cancers
PS Disclosure; Pages 145-150; 190pp; English.
CC The present sequence appears in the specification, which describes a
CC tetracycline responsive expression vector (TREV), which contains a
CC sequence encoding a fusion protein comprising a transcriptional
CC transactivation domain (TTD) operatively attached to a tetracycline
CC repressor protein (TRP), the first sequence operatively positioned
CC downstream of a promoter. The vector also contains a cloning site
CC operatively positioned downstream of a basal promoter comprising a
CC tetracycline operator. The TREVs can be used to produce stable cell
CC lines in which gene expression is tightly regulated by tetracycline.
CC They can be used for the production of proteins such as tumour
CC suppressor proteins which can be used for treating diseases characterised
CC by abnormal cellular proliferation, particularly cancers.

PT   New fusion polypeptide of, e.g. transcription factor  - used to
PT   treat, e.g. hyper-proliferative disease such as cancer and
PT   restenosis
PS   Example 1; Fig 2A; 91pp; English.
CC   This nucleotide sequence includes a coding region for retinoblastoma
CC   protein RB (see W62465).  A new claimed polypeptide is a fusion of:
CC   (i) a transcription factor (TF) comprising a DNA binding domain,
CC   and (ii) a retinoblastoma (Rb) polypeptide that includes a growth
CC   suppression domain.  Also new are: (1) a nucleic acid encoding the
CC   fusion protein, and (2) expression vectors containing such DNA.
CC   The fusion protein, particularly expressed from gene therapy
CC   vectors (especially adenovirus vectors), is used to treat
CC   hyperproliferative conditions, specifically cancer (particularly of
CC   the bladder) or restenosis (after angioplasty), but also diabetic
CC   retinopathy, thyroid hyperplasia, Grave's disease, psoriasis,
CC   benign prostatic hypertrophy, Li-Fraumeni syndrome and peripheral
CC   vascular disease.  Tissue-specific expression of E2F-RB fusions is
CC   provided.  The fusion proteins are more effective in repressing
CC   transcription of the E2F promoter than Rb alone and cause cell-cycle
CC   arrest in a variety of cells.

PT   Method of controlling cell cycle progression - uses purified
PT   retinoblastoma protein or fragment, for use in combination with
PT   therapeutic methods to arrest tumorigenesis
PS   Disclosure; Fig 9; 68pp; English.
CC   The sequence is that of the retinoblastoma gene which encodes the
CC   retinoblastoma (RB) protein which may be used as part of a method of
CC   controlling cell cycle progression which may be used in combination
CC   with therapeutic methods to arrest tumourigenesis in organisms. The
CC   cell cycle can be reversibly arrested in a convenient and safe
CC   manner. The protein is used in a compsn. is relatively inexpensive
CC   and readily obtainable, and shows little or no toxic effects on
CC   healthy cells. It is also compatible with other methods and devices
CC   for regulating certain physiological processes of the body, such as
CC   blood cell prodn. and gamete prodn. Fragments of the protein are
CC   soluble in low concns. of glycerol thus enhancing their value in
CC   pharmaceutical applicns.

PT Adenoviral vector with deletion of viral protein IX contains
PT foreign gene - esp. encoding tumour suppressor protein for gene
PT therapy of tumours, reduces contamination by wild type adenovirus
PS Disclosure; Fig 3; 92pp; English.
CC The sequence is that of the DNA sequence encoding a retinoblastoma
CC tumour protein. The gene can be used in a novel method involving a
CC recombinant adenovirus expression vector to treat diseases
CC associated with the ansence of the TSg or the presence of a mutated
CC TSG, e.g. many forms of carcinoma, sickle cell anaemia or Tay-Sach's
CC disease.
CC See also Q90060-5.

PT Inhibition of cancer cell proliferation - with retinoblastoma
PT protein or polypeptide
PS Example 1; Fig 2A-K; 72pp; English.
CC The present sequence encodes a human retinoblastoma (RB) protein
CC designated ppRB-110 or p110-RB. The protein is used in a method
CC for inhibiting proliferation of pathologically proliferating cells
CC lacking endogenous functional retinoblastoma protein. The method
CC comprises contacting the cells with a polypeptide comprising a 56 kD
CC C-terminal fragment of retinoblastoma protein. The method is useful
CC for treating cancers, especially retinoblastoma or secondary
CC osteosarcoma, breast cancer, small-cell lung cancer or fibrosarcoma.

PT   Diagnosing the presence of defective retinoblastoma alleles -
PT   comprises comparing genetic material corresponding to a normal
PT   human retinoblastoma with DNA from a patient.
PS   Example 2(2); Figure 7; 18pp; English.
CC   A method for detecting the presence, in a tumour sample, of a protein
CC   the absence of which is associated with a neoplasm, comprises
CC   producing an antibody to the protein and then contacting the
CC   antibody with the tumour sample.  Immune complexes indicate the
CC   presence of the protein in the sample.  The method may be used in
CC   the detection and treatment of a defective human gene related to
CC   cancer, in particular retinoblastoma.

PT Isolated human retinoblastoma gene - used to develop products for
PT analysing predisposition to retinoblastoma and for the detection and
PT treatment of retinoblastoma
PS Claim 8; Fig 5; 32pp; English.
CC This is the nucleic acid sequence of a cDNA of the normal human
CC retinoblastoma gene Rb. Absence or mutation of the Rb gene (see
CC also X04502) predisposes an individual to retinoblastoma. To
CC isolate Rb cDNA, the human DNA probe pH3-8, isolated from a human
CC chromosome 13 lambda phage library, was used in a chromosome walk
CC to isolate and map 30 kb of genomic DNA surrounding the H3-8
CC sequence. Fragment p7H30.7R (ATCC 97500) was obtained, and was
CC used as a probe to screen a cDNA library that had been constructed
CC from an adenovirus 12-transformed human embryonic retinal cell
CC line. This provided clone p4.7R (ATCC 97383), which in Northern
CC blots cross-reacted with a 4.7 kb transcript in transformed
CC retinal cells which was not present in 4 retinoblastoma and one
CC osteosarcoma cell samples. Rb nucleic acids comprising the Rb
CC gene, cDNA or a fragment of the gene, such as one of the 27 exons
CC or 26 introns, can be used in a claimed method for detecting a
CC deletion or point mutation in the Rb gene of a human patient. The
CC gene can also be used to synthesize Rb polypeptide (see Y01542) for

```
CC   use in the treatment of individuals determined to have a defective
CC   Rb allele.

PT   Admin. of a functional retinoblastoma polypeptide or protein  -
PT   used to prevent and inhibit prim. and sec. retinoblastoma-linked
PT   cancers
PS   Disclosure; Fig.2; 163pp; English.
CC   By chromosomal walking from the esterase D gene on chromosome 13,
CC   the retinoblastoma susceptibility gene (RB) was identified on the
CC   basis of chromosomal location, homologous deletion and tumor-specific
CC   alterations in expression.  Screening of cDNA libraries yielded clone
CC   RB-5 incorporating the complete RB cDNA sequence given in Q86398 and
CC   encoding a 110-140 kDa nuclear phosphoprotein named pp110RB (R71680).
CC   Use of recombinant pp110RB will reduce the need for conventional
CC   radiotherapy or chemotherapy.
SQ   Sequence   2995 BP;    975 A;    616 C;    594 G;    810 T;

PT   Diagnosis of retinoblastoma - using genetic material corresp. to a normal
PT   human retinoblastoma gene or a unique sub-region
PS   Disclosure; p; English.
CC   This gene encodes a protein, the absence of which is associated with a
CC   neoplasm.  It is used to produce an antibody to the protein, contacting
CC   this with the tumour sample and detecting immune complexes as indication
CC   of the presence in the tumour sample of the protein. Whole sequence or
CC   a unique sub-region can be used.  The method identifies patients lacking
CC   the defective retinoblastoma (Rb) allele and thus are not at risk of
CC   developing the disease.

PT   Retinoblastoma suppressor protein with N-terminal modification -
PT   inhibiting cellular proliferation, particularly cancer
PS   Claim 22; Page 158-162; 249pp; English.
CC   This sequence encodes a modified retinoblastoma tumour suppressor
CC   protein (RTSP) of the invention. The proteins can be used for inhibiting
CC   cellular proliferation, when coadministered with a p53 protein. The RTSPs
CC   can be used for treating diseases characterised by abnormal cellular
CC   proliferation, particularly cancers. The RTSPs have a broader spectrum of
CC   activity than wild type RTSPs.

PT   Retinoblastoma suppressor protein with N-terminal modification -
PT   inhibiting cellular proliferation, particularly cancer
PS   Claim 22; Page 142-147; 249pp; English.
CC   This sequence encodes a modified retinoblastoma tumour suppressor
CC   protein (RTSP) of the invention. The proteins can be used for inhibiting
CC   cellular proliferation, when coadministered with a p53 protein. The RTSPs
CC   can be used for treating diseases characterised by abnormal cellular
CC   proliferation, particularly cancers. The RTSPs have a broader spectrum of
CC   activity than wild type RTSPs.

PT   Controlling cancer -
PT   by replacing ineffective cancer suppressing gene with cloned,
PT   active gene.
PS   Claim 35; Page 86; 105pp; English.

CC   Gene is taken from human chromosome 13q14 retinoblastoma (RB) cDNA.
CC   By installing a working CSG, safe and specific treatment and
CC   prophylaxis can be given to cancer patients.

PT   Method of controlling cell cycle progression - uses purified
PT   retinoblastoma protein or fragment, for use in combination with
PT   therapeutic methods to arrest tumorigenesis
PS   Disclosure; Fig 9; 68pp; English.
CC   The sequence is that of the retinoblastoma gene which encodes the
CC   retinoblastoma (RB) protein which may be used as part of a method of
CC   controlling cell cycle progression which may be used in combination
CC   with therapeutic methods to arrest tumourigenesis in organisms. The
CC   cell cycle can be reversibly arrested in a convenient and safe
CC   manner. The protein is used in a compsn. is relatively inexpensive
CC   and readily obtainable, and shows little or no toxic effects on
CC   healthy cells. It is also compatible with other methods and devices
CC   for regulating certain physiological processes of the body, such as
CC   blood cell prodn. and gamete prodn. Fragments of the protein are
CC   soluble in low concns. of glycerol thus enhancing their value in
CC   pharmaceutical applicns.

PT   Retinoblastoma suppressor protein with N-terminal modification -
PT   inhibiting cellular proliferation, particularly cancer
PS   Disclosure; Page 121-126; 249pp; English.
CC   This sequence encodes a modified retinoblastoma tumour suppressor
CC   protein (RTSP) of the invention. The proteins can be used for inhibiting
CC   cellular proliferation, when coadministered with a p53 protein. The RTSPs
CC   can be used for treating diseases characterised by abnormal cellular
CC   proliferation, particularly cancers. The RTSPs have a broader spectrum of
CC   activity than wild type RTSPs.

PT New tetracycline responsive expression vectors - used for the
PT tightly controlled expression of genes, such as tumour suppressor
PT genes for treating cancers
PS Disclosure; Pages 145-150; 190pp; English.
CC The present sequence appears in the specification, which describes a
CC tetracycline responsive expression vector (TREV), which contains a
CC sequence encoding a fusion protein comprising a transcriptional
CC transactivation domain (TTD) operatively attached to a tetracycline
CC repressor protein (TRP), the first sequence operatively positioned
CC downstream of a promoter. The vector also contains a cloning site
CC operatively positioned downstream of a basal promoter comprising a
CC tetracycline operator. The TREVs can be used to produce stable cell
CC lines in which gene expression is tightly regulated by tetracycline.
CC They can be used for the production of proteins such as tumour
CC suppressor proteins which can be used for treating diseases characterised
CC by abnormal cellular proliferation, particularly cancers.

PT	treat, e.g. hyper-proliferative disease such as cancer and	
PT	restenosis	
PS	Example 1; Fig 2A; 91pp; English.	

CC This nucleotide sequence includes a coding region for retinoblastoma
CC protein RB (see W62465). A new claimed polypeptide is a fusion of:
CC (i) a transcription factor (TF) comprising a DNA binding domain,
CC and (ii) a retinoblastoma (Rb) polypeptide that includes a growth
CC suppression domain. Also new are: (1) a nucleic acid encoding the
CC fusion protein, and (2) expression vectors containing such DNA.
CC The fusion protein, particularly expressed from gene therapy
CC vectors (especially adenovirus vectors), is used to treat
CC hyperproliferative conditions, specifically cancer (particularly of
CC the bladder) or restenosis (after angioplasty), but also diabetic
CC retinopathy, thyroid hyperplasia, Grave's disease, psoriasis,
CC benign prostatic hypertrophy, Li-Fraumeni syndrome and peripheral
CC vascular disease. Tissue-specific expression of E2F-RB fusions is
CC provided. The fusion proteins are more effective in repressing
CC transcription of the E2F promoter than Rb alone and cause cell-cycle
CC arrest in a variety of cells.

SQ Sequence 2994 BP; 974 A; 618 C; 593 G; 809 T;

PT   Inhibition of cancer cell proliferation - with retinoblastoma
PT   protein or polypeptide
PS   Example 1; Fig 2A-K; 72pp; English.
CC   The present sequence encodes a human retinoblastoma (RB) protein
CC   designated ppRB-110 or p110-RB. The protein is used in a method
CC   for inhibiting proliferation of pathologically proliferating cells
CC   lacking endogenous functional retinoblastoma protein. The method
CC   comprises contacting the cells with a polypeptide comprising a 56 kD
CC   C-terminal fragment of retinoblastoma protein. The method is useful
CC   for treating cancers, especially retinoblastoma or secondary
CC   osteosarcoma, breast cancer, small-cell lung cancer or fibrosarcoma.

PT   Retinoblastoma suppressor protein with N-terminal modification -
PT   inhibiting cellular proliferation, particularly cancer
PS   Claim 22; Page 150-155; 249pp; English.
CC   This sequence encodes a modified retinoblastoma tumour suppressor
CC   protein (RTSP) of the invention. The proteins can be used for inhibiting
CC   cellular proliferation, when coadministered with a p53 protein. The RTSPs
CC   can be used for treating diseases characterised by abnormal cellular
CC   proliferation, particularly cancers. The RTSPs have a broader spectrum of
CC   activity than wild type RTSPs.

PT Retinoblastoma suppressor protein with N-terminal modification -
PT inhibiting cellular proliferation, particularly cancer
PS Claim 22; Page 158-162; 249pp; English.
CC This sequence encodes a modified retinoblastoma tumour suppressor
CC protein (RTSP) of the invention. The proteins can be used for inhibiting
CC cellular proliferation, when coadministered with a p53 protein. The RTSPs
CC can be used for treating diseases characterised by abnormal cellular
CC proliferation, particularly cancers. The RTSPs have a broader spectrum of
CC activity than wild type RTSPs.

PT   Isolated human retinoblastoma gene - used to develop products for
PT   analysing predisposition to retinoblastoma and for the detection and
```

```
PT   treatment of retinoblastoma
PS   Claim 8; Fig 5; 32pp; English.
CC   This is the nucleic acid sequence of a cDNA of the normal human
CC   retinoblastoma gene Rb.  Absence or mutation of the Rb gene (see
CC   also X04502) predisposes an individual to retinoblastoma.  To
CC   isolate Rb cDNA, the human DNA probe pH3-8, isolated from a human
CC   chromosome 13 lambda phage library, was used in a chromosome walk
CC   to isolate and map 30 kb of genomic DNA surrounding the H3-8
CC   sequence.  Fragment p7H30.7R (ATCC 97500) was obtained, and was
CC   used as a probe to screen a cDNA library that had been constructed
CC   from an adenovirus 12-transformed human embryonic retinal cell
CC   line.  This provided clone p4.7R (ATCC 97383), which in Northern
CC   blots cross-reacted with a 4.7 kb transcript in transformed
CC   retinal cells which was not present in 4 retinoblastoma and one
CC   osteosarcoma cell samples.  Rb nucleic acids comprising the Rb
CC   gene, cDNA or a fragment of the gene, such as one of the 27 exons
CC   or 26 introns, can be used in a claimed method for detecting a
CC   deletion or point mutation in the Rb gene of a human patient.  The
CC   gene can also be used to synthesize Rb polypeptide (see Y01542) for
CC   use in the treatment of individuals determined to have a defective
CC   Rb allele.

PT Retinoblastoma suppressor protein with N-terminal modification -
PT inhibiting cellular proliferation, particularly cancer
PS Claim 22; Page 166-170; 249pp; English.
CC This sequence encodes a modified retinoblastoma tumour suppressor
CC protein (RTSP) of the invention. The proteins can be used for inhibiting
CC cellular proliferation, when coadministered with a p53 protein. The RTSPs
CC can be used for treating diseases characterised by abnormal cellular
CC proliferation, particularly cancers. The RTSPs have a broader spectrum of
CC activity than wild type RTSPs.

PT   Broad spectrum tumour suppressor gene - by using retinoblastoma
PT   gene product p94RB to suppress abnormal cell proliferation in the
PT   treatment of cancer
PS   Claim 4; Fig 1; 115pp; English.
CC   Q72690 is the fragment of p94RB (a broad-spectrum tumour suppressor
CC   gene) which encodes the 94kD therapeutic retinoblastoma protein
CC   R63564. Expression of this protein in an abnormally proliferating
CC   cell causes that cell to enter a senescent-like state, terminating
CC   the proliferation. R63564 also has the advantage of engendering a low
CC   incidence of tumour suppressor gene resistance in a population of
CC   treated cells.

PT   Retinoblastoma suppressor protein with N-terminal modification -
PT   inhibiting cellular proliferation, particularly cancer
PS   Claim 22; Page 226-230; 249pp; English.
CC   This sequence encodes a modified retinoblastoma tumour suppressor
CC   protein (RTSP) of the invention. The proteins can be used for inhibiting
CC   cellular proliferation, when coadministered with a p53 protein. The RTSPs
CC   can be used for treating diseases characterised by abnormal cellular
CC   proliferation, particularly cancers. The RTSPs have a broader spectrum of
CC   activity than wild type RTSPs.

PT   Retinoblastoma suppressor protein with N-terminal modification -
PT   inhibiting cellular proliferation, particularly cancer
PS   Claim 22; Page 150-155; 249pp; English.
CC   This sequence encodes a modified retinoblastoma tumour suppressor
CC   protein (RTSP) of the invention. The proteins can be used for inhibiting
CC   cellular proliferation, when coadministered with a p53 protein. The RTSPs
CC   can be used for treating diseases characterised by abnormal cellular
CC   proliferation, particularly cancers. The RTSPs have a broader spectrum of
CC   activity than wild type RTSPs.

PT   Method of controlling cell cycle progression - uses purified
PT   retinoblastoma protein or fragment, for use in combination with
PT   therapeutic methods to arrest tumorigenesis
PS   Disclosure; Fig 9; 68pp; English.
CC   The sequence is that of the retinoblastoma gene which encodes the
CC   retinoblastoma (RB) protein which may be used as part of a method of
CC   controlling cell cycle progression which may be used in combination
CC   with therapeutic methods to arrest tumourigenesis in organisms. The
CC   cell cycle can be reversibly arrested in a convenient and safe
CC   manner. The protein is used in a compsn. is relatively inexpensive
CC   and readily obtainable, and shows little or no toxic effects on
CC   healthy cells. It is also compatible with other methods and devices
CC   for regulating certain physiological processes of the body, such as
CC   blood cell prodn. and gamete prodn. Fragments of the protein are
CC   soluble in low concns. of glycerol thus enhancing their value in
CC   pharmaceutical applicns.

PT Retinoblastoma suppressor protein with N-terminal modification -
PT inhibiting cellular proliferation, particularly cancer
PS Disclosure; Page 121-126; 249pp; English.
CC This sequence encodes a modified retinoblastoma tumour suppressor
CC protein (RTSP) of the invention. The proteins can be used for inhibiting
CC cellular proliferation, when coadministered with a p53 protein. The RTSPs
CC can be used for treating diseases characterised by abnormal cellular
CC proliferation, particularly cancers. The RTSPs have a broader spectrum of
CC activity than wild type RTSPs.

PT   Retinoblastoma suppressor protein with N-terminal modification -
PT   inhibiting cellular proliferation, particularly cancer
PS   Claim 22; Page 142-147; 249pp; English.
CC   This sequence encodes a modified retinoblastoma tumour suppressor
CC   protein (RTSP) of the invention. The proteins can be used for inhibiting
CC   cellular proliferation, when coadministered with a p53 protein. The RTSPs
CC   can be used for treating diseases characterised by abnormal cellular
CC   proliferation, particularly cancers. The RTSPs have a broader spectrum of
CC   activity than wild type RTSPs.

PT   New tetracycline responsive expression vectors - used for the
PT   tightly controlled expression of genes, such as tumour suppressor
PT   genes for treating cancers
PS   Disclosure; Pages 145-150; 190pp; English.
CC   The present sequence appears in the specification, which describes a
CC   tetracycline responsive expression vector (TREV), which contains a
CC   sequence encoding a fusion protein comprising a transcriptional
CC   transactivation domain (TTD) operatively attached to a tetracycline
CC   repressor protein (TRP), the first sequence operatively positioned
CC   downstream of a promoter. The vector also contains a cloning site
CC   operatively positioned downstream of a basal promoter comprising a
CC   tetracycline operator. The TREVs can be used to produce stable cell
CC   lines in which gene expression is tightly regulated by tetracycline.
CC   They can be used for the production of proteins such as tumour
CC   suppressor proteins which can be used for treating diseases characterised
CC   by abnormal cellular proliferation, particularly cancers.

PT   New fusion polypeptide of, e.g. transcription factor  - used to
PT   treat, e.g. hyper-proliferative disease such as cancer and
PT   restenosis
PS   Example 1; Fig 2A; 91pp; English.
CC   This nucleotide sequence includes a coding region for retinoblastoma
CC   protein RB (see W62465).  A new claimed polypeptide is a fusion of:
CC   (i) a transcription factor (TF) comprising a DNA binding domain,
CC   and (ii) a retinoblastoma (Rb) polypeptide that includes a growth
CC   suppression domain.  Also new are: (1) a nucleic acid encoding the
CC   fusion protein, and (2) expression vectors containing such DNA.
CC   The fusion protein, particularly expressed from gene therapy
CC   vectors (especially adenovirus vectors), is used to treat
CC   hyperproliferative conditions, specifically cancer (particularly of
CC   the bladder) or restenosis (after angioplasty), but also diabetic
CC   retinopathy, thyroid hyperplasia, Grave's disease, psoriasis,
CC   benign prostatic hypertrophy, Li-Fraumeni syndrome and peripheral
CC   vascular disease.  Tissue-specific expression of E2F-RB fusions is
CC   provided.  The fusion proteins are more effective in repressing
CC   transcription of the E2F promoter than Rb alone and cause cell-cycle
CC   arrest in a variety of cells.

PT   Inhibition of cancer cell proliferation - with retinoblastoma
PT   protein or polypeptide
PS   Example 1; Fig 2A-K; 72pp; English.
CC   The present sequence encodes a human retinoblastoma (RB) protein
CC   designated ppRB-110 or p110-RB. The protein is used in a method
CC   for inhibiting proliferation of pathologically proliferating cells
CC   lacking endogenous functional retinoblastoma protein. The method
CC   comprises contacting the cells with a polypeptide comprising a 56 kD
CC   C-terminal fragment of retinoblastoma protein. The method is useful
CC   for treating cancers, especially retinoblastoma or secondary
CC   osteosarcoma, breast cancer, small-cell lung cancer or fibrosarcoma.

PT Retinoblastoma suppressor protein with N-terminal modification -
PT inhibiting cellular proliferation, particularly cancer
PS Claim 22; Page 158-162; 249pp; English.
CC This sequence encodes a modified retinoblastoma tumour suppressor
CC protein (RTSP) of the invention. The proteins can be used for inhibiting
CC cellular proliferation, when coadministered with a p53 protein. The RTSPs
CC can be used for treating diseases characterised by abnormal cellular
CC proliferation, particularly cancers. The RTSPs have a broader spectrum of
CC activity than wild type RTSPs.

PT Retinoblastoma suppressor protein with N-terminal modification -
PT inhibiting cellular proliferation, particularly cancer
PS Claim 22; Page 166-170; 249pp; English.
CC This sequence encodes a modified retinoblastoma tumour suppressor
CC protein (RTSP) of the invention. The proteins can be used for inhibiting
CC cellular proliferation, when coadministered with a p53 protein. The RTSPs
CC can be used for treating diseases characterised by abnormal cellular
CC proliferation, particularly cancers. The RTSPs have a broader spectrum of
CC activity than wild type RTSPs.

PT   Isolated human retinoblastoma gene - used to develop products for
PT   analysing predisposition to retinoblastoma and for the detection and
PT   treatment of retinoblastoma
PS   Claim 8; Fig 5; 32pp; English.
CC   This is the nucleic acid sequence of a cDNA of the normal human
CC   retinoblastoma gene Rb.  Absence or mutation of the Rb gene (see
CC   also X04502) predisposes an individual to retinoblastoma.  To
CC   isolate Rb cDNA, the human DNA probe pH3-8, isolated from a human
CC   chromosome 13 lambda phage library, was used in a chromosome walk
CC   to isolate and map 30 kb of genomic DNA surrounding the H3-8
CC   sequence.  Fragment p7H30.7R (ATCC 97500) was obtained, and was
CC   used as a probe to screen a cDNA library that had been constructed
CC   from an adenovirus 12-transformed human embryonic retinal cell
CC   line.  This provided clone p4.7R (ATCC 97383), which in Northern
CC   blots cross-reacted with a 4.7 kb transcript in transformed
CC   retinal cells which was not present in 4 retinoblastoma and one
CC   osteosarcoma cell samples.  Rb nucleic acids comprising the Rb
CC   gene, cDNA or a fragment of the gene, such as one of the 27 exons
CC   or 26 introns, can be used in a claimed method for detecting a
CC   deletion or point mutation in the Rb gene of a human patient.  The
CC   gene can also be used to synthesize Rb polypeptide (see Y01542) for
CC   use in the treatment of individuals determined to have a defective
CC   Rb allele.

PT   Broad spectrum tumour suppressor gene - by using retinoblastoma
PT   gene product p94RB to suppress abnormal cell proliferation in the
PT   treatment of cancer
PS   Claim 4; Fig 1; 115pp; English.
CC   Q72690 is the fragment of p94RB (a broad-spectrum tumour suppressor
CC   gene) which encodes the 94kD therapeutic retinoblastoma protein
CC   R63564. Expression of this protein in an abnormally proliferating
CC   cell causes that cell to enter a senescent-like state, terminating
CC   the proliferation. R63564 also has the advantage of engendering a low
CC   incidence of tumour suppressor gene resistance in a population of
CC   treated cells.

PT   Retinoblastoma suppressor protein with N-terminal modification -
PT   inhibiting cellular proliferation, particularly cancer
PS   Claim 22; Page 226-230; 249pp; English.
CC   This sequence encodes a modified retinoblastoma tumour suppressor
CC   protein (RTSP) of the invention. The proteins can be used for inhibiting
CC   cellular proliferation, when coadministered with a p53 protein. The RTSPs
CC   can be used for treating diseases characterised by abnormal cellular
CC   proliferation, particularly cancers. The RTSPs have a broader spectrum of
CC   activity than wild type RTSPs.

PT   Retinoblastoma suppressor protein with N-terminal modification -
PT   inhibiting cellular proliferation, particularly cancer
PS   Claim 22; Page 158-162; 249pp; English.
CC   This sequence encodes a modified retinoblastoma tumour suppressor
CC   protein (RTSP) of the invention. The proteins can be used for inhibiting
CC   cellular proliferation, when coadministered with a p53 protein. The RTSPs
CC   can be used for treating diseases characterised by abnormal cellular
CC   proliferation, particularly cancers. The RTSPs have a broader spectrum of
CC   activity than wild type RTSPs.

PT   Method of controlling cell cycle progression - uses purified
PT   retinoblastoma protein or fragment, for use in combination with
PT   therapeutic methods to arrest tumorigenesis
PS   Disclosure; Fig 9; 68pp; English.
CC   The sequence is that of the retinoblastoma gene which encodes the
CC   retinoblastoma (RB) protein which may be used as part of a method of
CC   controlling cell cycle progression which may be used in combination
CC   with therapeutic methods to arrest tumourigenesis in organisms. The
CC   cell cycle can be reversibly arrested in a convenient and safe
CC   manner. The protein is used in a compsn. is relatively inexpensive
CC   and readily obtainable, and shows little or no toxic effects on
CC   healthy cells. It is also compatible with other methods and devices
CC   for regulating certain physiological processes of the body, such as
CC   blood cell prodn. and gamete prodn. Fragments of the protein are
CC   soluble in low concns. of glycerol thus enhancing their value in
CC   pharmaceutical applicns.

PT   Retinoblastoma suppressor protein with N-terminal modification -
PT   inhibiting cellular proliferation, particularly cancer
PS   Disclosure; Page 121-126; 249pp; English.
CC   This sequence encodes a modified retinoblastoma tumour suppressor
CC   protein (RTSP) of the invention. The proteins can be used for inhibiting
CC   cellular proliferation, when coadministered with a p53 protein. The RTSPs
CC   can be used for treating diseases characterised by abnormal cellular
CC   proliferation, particularly cancers. The RTSPs have a broader spectrum of
CC   activity than wild type RTSPs.

PT   Retinoblastoma suppressor protein with N-terminal modification -
PT   inhibiting cellular proliferation, particularly cancer
PS   Claim 22; Page 142-147; 249pp; English.
CC   This sequence encodes a modified retinoblastoma tumour suppressor
CC   protein (RTSP) of the invention. The proteins can be used for inhibiting
CC   cellular proliferation, when coadministered with a p53 protein. The RTSPs
CC   can be used for treating diseases characterised by abnormal cellular
CC   proliferation, particularly cancers. The RTSPs have a broader spectrum of
CC   activity than wild type RTSPs.

```
CC   The present sequence appears in the specification, which describes a
CC   tetracycline responsive expression vector (TREV), which contains a
CC   sequence encoding a fusion protein comprising a transcriptional
CC   transactivation domain (TTD) operatively attached to a tetracycline
CC   repressor protein (TRP), the first sequence operatively positioned
CC   downstream of a promoter. The vector also contains a cloning site
CC   operatively positioned downstream of a basal promoter comprising a
CC   tetracycline operator. The TREVs can be used to produce stable cell
CC   lines in which gene expression is tightly regulated by tetracycline.
CC   They can be used for the production of proteins such as tumour
CC   suppressor proteins which can be used for treating diseases characterised
CC   by abnormal cellular proliferation, particularly cancers.

PT   New fusion polypeptide of, e.g. transcription factor  - used to
PT   treat, e.g. hyper-proliferative disease such as cancer and
PT   restenosis
PS   Example 1; Fig 2A; 91pp; English.
CC   This nucleotide sequence includes a coding region for retinoblastoma
CC   protein RB (see W62465).  A new claimed polypeptide is a fusion of:
CC   (i) a transcription factor (TF) comprising a DNA binding domain,
CC   and (ii) a retinoblastoma (Rb) polypeptide that includes a growth
CC   suppression domain.  Also new are: (1) a nucleic acid encoding the
CC   fusion protein, and (2) expression vectors containing such DNA.
CC   The fusion protein, particularly expressed from gene therapy
CC   vectors (especially adenovirus vectors), is used to treat
CC   hyperproliferative conditions, specifically cancer (particularly of
CC   the bladder) or restenosis (after angioplasty), but also diabetic
CC   retinopathy, thyroid hyperplasia, Grave's disease, psoriasis,
CC   benign prostatic hypertrophy, Li-Fraumeni syndrome and peripheral
CC   vascular disease.  Tissue-specific expression of E2F-RB fusions is
CC   provided.  The fusion proteins are more effective in repressing
CC   transcription of the E2F promoter than Rb alone and cause cell-cycle
CC   arrest in a variety of cells.
SQ   Sequence   2994 BP;    974 A;    618 C;    593 G;    809 T;

PT   Inhibition of cancer cell proliferation - with retinoblastoma
PT   protein or polypeptide
PS   Example 1; Fig 2A-K; 72pp; English.
CC   The present sequence encodes a human retinoblastoma (RB) protein
CC   designated ppRB-110 or p110-RB. The protein is used in a method
CC   for inhibiting proliferation of pathologically proliferating cells
CC   lacking endogenous functional retinoblastoma protein. The method
CC   comprises contacting the cells with a polypeptide comprising a 56 kD
CC   C-terminal fragment of retinoblastoma protein. The method is useful
CC   for treating cancers, especially retinoblastoma or secondary
CC   osteosarcoma, breast cancer, small-cell lung cancer or fibrosarcoma.

PT   Retinoblastoma suppressor protein with N-terminal modification -
PT   inhibiting cellular proliferation, particularly cancer
PS   Claim 22; Page 180-184; 249pp; English.
CC   This sequence encodes a modified retinoblastoma tumour suppressor
CC   protein (RTSP) of the invention. The proteins can be used for inhibiting
CC   cellular proliferation, when coadministered with a p53 protein. The RTSPs
CC   can be used for treating diseases characterised by abnormal cellular
CC   proliferation, particularly cancers. The RTSPs have a broader spectrum of
CC   activity than wild type RTSPs.

PT   Broad spectrum tumour suppressor gene - by using retinoblastoma
PT   gene product p94RB to suppress abnormal cell proliferation in the
PT   treatment of cancer
PS   Claim 4; Fig 1; 115pp; English.
CC   Q72690 is the fragment of p94RB (a broad-spectrum tumour suppressor
CC   gene) which encodes the 94kD therapeutic retinoblastoma protein
CC   R63564. Expression of this protein in an abnormally proliferating
CC   cell causes that cell to enter a senescent-like state, terminating
CC   the proliferation. R63564 also has the advantage of engendering a low
CC   incidence of tumour suppressor gene resistance in a population of
CC   treated cells.

PT Retinoblastoma suppressor protein with N-terminal modification - inhibiting cellular proliferation, particularly cancer
PS Claim 22; Page 226-230; 249pp; English.
CC This sequence encodes a modified retinoblastoma tumour suppressor protein (RTSP) of the invention. The proteins can be used for inhibiting cellular proliferation, when coadministered with a p53 protein. The RTSPs can be used for treating diseases characterised by abnormal cellular proliferation, particularly cancers. The RTSPs have a broader spectrum of activity than wild type RTSPs.

PT   New tetracycline responsive expression vectors - used for the
PT   tightly controlled expression of genes, such as tumour suppressor
PT   genes for treating cancers
PS   Disclosure; Pages 153-157; 190pp; English.
CC   The present sequence appears in the specification, which describes a
CC   tetracycline responsive expression vector (TREV), which contains a
CC   sequence encoding a fusion protein comprising a transcriptional
CC   transactivation domain (TTD) operatively attached to a tetracycline
CC   repressor protein (TRP), the first sequence operatively positioned
CC   downstream of a promoter. The vector also contains a cloning site
CC   operatively positioned downstream of a basal promoter comprising a
CC   tetracycline operator. The TREVs can be used to produce stable cell
CC   lines in which gene expression is tightly regulated by tetracycline.
CC   They can be used for the production of proteins such as tumour
CC   suppressor proteins which can be used for treating diseases characterised
CC   by abnormal cellular proliferation, particularly cancers.
SQ   Sequence   3218 BP;    1080 A;    595 C;    561 G;    982 T;

PT   Retinoblastoma suppressor protein with N-terminal modification -
PT   inhibiting cellular proliferation, particularly cancer
PS   Claim 22; Page 166-170; 249pp; English.
CC   This sequence encodes a modified retinoblastoma tumour suppressor
CC   protein (RTSP) of the invention. The proteins can be used for inhibiting
CC   cellular proliferation, when coadministered with a p53 protein. The RTSPs
CC   can be used for treating diseases characterised by abnormal cellular
CC   proliferation, particularly cancers. The RTSPs have a broader spectrum of
CC   activity than wild type RTSPs.

PT   Method of controlling cell cycle progression - uses purified
PT   retinoblastoma protein or fragment, for use in combination with
PT   therapeutic methods to arrest tumorigenesis
PS   Disclosure; Fig 9; 68pp; English.
CC   The sequence is that of the retinoblastoma gene which encodes the
CC   retinoblastoma (RB) protein which may be used as part of a method of
CC   controlling cell cycle progression which may be used in combination
CC   with therapeutic methods to arrest tumourigenesis in organisms. The
CC   cell cycle can be reversibly arrested in a convenient and safe
CC   manner. The protein is used in a compsn. is relatively inexpensive
CC   and readily obtainable, and shows little or no toxic effects on
CC   healthy cells. It is also compatible with other methods and devices
CC   for regulating certain physiological processes of the body, such as
CC   blood cell prodn. and gamete prodn. Fragments of the protein are
CC   soluble in low concns. of glycerol thus enhancing their value in
CC   pharmaceutical applicns.

PT Retinoblastoma suppressor protein with N-terminal modification -
PT inhibiting cellular proliferation, particularly cancer
PS Disclosure; Page 121-126; 249pp; English.
CC This sequence encodes a modified retinoblastoma tumour suppressor
CC protein (RTSP) of the invention. The proteins can be used for inhibiting
CC cellular proliferation, when coadministered with a p53 protein. The RTSPs
CC can be used for treating diseases characterised by abnormal cellular
CC proliferation, particularly cancers. The RTSPs have a broader spectrum of
CC activity than wild type RTSPs.

PT   Retinoblastoma suppressor protein with N-terminal modification -
PT   inhibiting cellular proliferation, particularly cancer
PS   Claim 22; Page 158-162; 249pp; English.
CC   This sequence encodes a modified retinoblastoma tumour suppressor
CC   protein (RTSP) of the invention. The proteins can be used for inhibiting
CC   cellular proliferation, when coadministered with a p53 protein. The RTSPs
CC   can be used for treating diseases characterised by abnormal cellular
CC   proliferation, particularly cancers. The RTSPs have a broader spectrum of
CC   activity than wild type RTSPs.

PT   New tetracycline responsive expression vectors - used for the
PT   tightly controlled expression of genes, such as tumour suppressor
PT   genes for treating cancers
PS   Disclosure; Pages 145-150; 190pp; English.
CC   The present sequence appears in the specification, which describes a
CC   tetracycline responsive expression vector (TREV), which contains a
CC   sequence encoding a fusion protein comprising a transcriptional
CC   transactivation domain (TTD) operatively attached to a tetracycline
CC   repressor protein (TRP), the first sequence operatively positioned
CC   downstream of a promoter. The vector also contains a cloning site
CC   operatively positioned downstream of a basal promoter comprising a
CC   tetracycline operator. The TREVs can be used to produce stable cell
CC   lines in which gene expression is tightly regulated by tetracycline.
CC   They can be used for the production of proteins such as tumour
CC   suppressor proteins which can be used for treating diseases characterised
CC   by abnormal cellular proliferation, particularly cancers.

PT   New fusion polypeptide of, e.g. transcription factor  - used to
PT   treat, e.g. hyper-proliferative disease such as cancer and
PT   restenosis
PS   Example 1; Fig 2A; 91pp; English.
CC   This nucleotide sequence includes a coding region for retinoblastoma
CC   protein RB (see W62465).  A new claimed polypeptide is a fusion of:
CC   (i) a transcription factor (TF) comprising a DNA binding domain,
CC   and (ii) a retinoblastoma (Rb) polypeptide that includes a growth
CC   suppression domain.  Also new are: (1) a nucleic acid encoding the
CC   fusion protein, and (2) expression vectors containing such DNA.
CC   The fusion protein, particularly expressed from gene therapy
CC   vectors (especially adenovirus vectors), is used to treat
CC   hyperproliferative conditions, specifically cancer (particularly of
CC   the bladder) or restenosis (after angioplasty), but also diabetic
CC   retinopathy, thyroid hyperplasia, Grave's disease, psoriasis,
CC   benign prostatic hypertrophy, Li-Fraumeni syndrome and peripheral
CC   vascular disease.  Tissue-specific expression of E2F-RB fusions is
CC   provided.  The fusion proteins are more effective in repressing
CC   transcription of the E2F promoter than Rb alone and cause cell-cycle
CC   arrest in a variety of cells.
SQ   Sequence   2994 BP;    974 A;    618 C;    593 G;    809 T;

PT Inhibition of cancer cell proliferation - with retinoblastoma
PT protein or polypeptide
PS Example 1; Fig 2A-K; 72pp; English.
CC The present sequence encodes a human retinoblastoma (RB) protein
CC designated ppRB-110 or p110-RB. The protein is used in a method
CC for inhibiting proliferation of pathologically proliferating cells
CC lacking endogenous functional retinoblastoma protein. The method
CC comprises contacting the cells with a polypeptide comprising a 56 kD
CC C-terminal fragment of retinoblastoma protein. The method is useful
CC for treating cancers, especially retinoblastoma or secondary
CC osteosarcoma, breast cancer, small-cell lung cancer or fibrosarcoma.

PT   Retinoblastoma suppressor protein with N-terminal modification -
PT   inhibiting cellular proliferation, particularly cancer
PS   Claim 22; Page 188-192; 249pp; English.
CC   This sequence encodes a modified retinoblastoma tumour suppressor
CC   protein (RTSP) of the invention. The proteins can be used for inhibiting
CC   cellular proliferation, when coadministered with a p53 protein. The RTSPs
CC   can be used for treating diseases characterised by abnormal cellular
CC   proliferation, particularly cancers. The RTSPs have a broader spectrum of
CC   activity than wild type RTSPs.

PT   Retinoblastoma suppressor protein with N-terminal modification -
PT   inhibiting cellular proliferation, particularly cancer
PS   Claim 22; Page 180-184; 249pp; English.
CC   This sequence encodes a modified retinoblastoma tumour suppressor
CC   protein (RTSP) of the invention. The proteins can be used for inhibiting
CC   cellular proliferation, when coadministered with a p53 protein. The RTSPs
CC   can be used for treating diseases characterised by abnormal cellular
CC   proliferation, particularly cancers. The RTSPs have a broader spectrum of
CC   activity than wild type RTSPs.

PT   Broad spectrum tumour suppressor gene - by using retinoblastoma
PT   gene product p94RB to suppress abnormal cell proliferation in the
PT   treatment of cancer
PS   Claim 4; Fig 1; 115pp; English.
CC   Q72690 is the fragment of p94RB (a broad-spectrum tumour suppressor
CC   gene) which encodes the 94kD therapeutic retinoblastoma protein
CC   R63564. Expression of this protein in an abnormally proliferating
CC   cell causes that cell to enter a senescent-like state, terminating
CC   the proliferation. R63564 also has the advantage of engendering a low
CC   incidence of tumour suppressor gene resistance in a population of
CC   treated cells.

PT Retinoblastoma suppressor protein with N-terminal modification -
PT inhibiting cellular proliferation, particularly cancer
PS Claim 22; Page 226-230; 249pp; English.
CC This sequence encodes a modified retinoblastoma tumour suppressor
CC protein (RTSP) of the invention. The proteins can be used for inhibiting
CC cellular proliferation, when coadministered with a p53 protein. The RTSPs
CC can be used for treating diseases characterised by abnormal cellular
CC proliferation, particularly cancers. The RTSPs have a broader spectrum of
CC activity than wild type RTSPs.

PT New tetracycline responsive expression vectors - used for the
PT tightly controlled expression of genes, such as tumour suppressor
PT genes for treating cancers
PS Disclosure; Pages 153-157; 190pp; English.
CC The present sequence appears in the specification, which describes a
CC tetracycline responsive expression vector (TREV), which contains a
CC sequence encoding a fusion protein comprising a transcriptional
CC transactivation domain (TTD) operatively attached to a tetracycline
CC repressor protein (TRP), the first sequence operatively positioned
CC downstream of a promoter. The vector also contains a cloning site
CC operatively positioned downstream of a basal promoter comprising a
CC tetracycline operator. The TREVs can be used to produce stable cell
CC lines in which gene expression is tightly regulated by tetracycline.
CC They can be used for the production of proteins such as tumour
CC suppressor proteins which can be used for treating diseases characterised
CC by abnormal cellular proliferation, particularly cancers.

PT   Controlling cancer -
PT   by replacing ineffective cancer suppressing gene with cloned,
PT   active gene.
PS   Claim 35; Page 86; 105pp; English.
CC   Gene is taken from human chromosome 13q14 retinoblastoma (RB) cDNA.
CC   By installing a working CSG, safe and specific treatment and
CC   prophylaxis can be given to cancer patients.

PT   Method of controlling cell cycle progression - uses purified
PT   retinoblastoma protein or fragment, for use in combination with
PT   therapeutic methods to arrest tumorigenesis
PS   Disclosure; Fig 9; 68pp; English.
CC   The sequence is that of the retinoblastoma gene which encodes the
CC   retinoblastoma (RB) protein which may be used as part of a method of
CC   controlling cell cycle progression which may be used in combination
CC   with therapeutic methods to arrest tumourigenesis in organisms. The
CC   cell cycle can be reversibly arrested in a convenient and safe
CC   manner. The protein is used in a compsn. is relatively inexpensive
CC   and readily obtainable, and shows little or no toxic effects on
CC   healthy cells. It is also compatible with other methods and devices
CC   for regulating certain physiological processes of the body, such as
CC   blood cell prodn. and gamete prodn. Fragments of the protein are
CC   soluble in low concns. of glycerol thus enhancing their value in
CC   pharmaceutical applicns.

PT   Broad spectrum tumour suppressor gene - by using retinoblastoma
PT   gene product p94RB to suppress abnormal cell proliferation in the
PT   treatment of cancer
PS   Claim 4; Fig 1; 115pp; English.
CC   Q72690 is the fragment of p94RB (a broad-spectrum tumour suppressor
CC   gene) which encodes the 94kD therapeutic retinoblastoma protein
CC   R63564. Expression of this protein in an abnormally proliferating
CC   cell causes that cell to enter a senescent-like state, terminating
CC   the proliferation. R63564 also has the advantage of engendering a low
CC   incidence of tumour suppressor gene resistance in a population of
CC   treated cells.

PT   Retinoblastoma suppressor protein with N-terminal modification -
PT   inhibiting cellular proliferation, particularly cancer
PS   Disclosure; Page 121-126; 249pp; English.
CC   This sequence encodes a modified retinoblastoma tumour suppressor
CC   protein (RTSP) of the invention. The proteins can be used for inhibiting
CC   cellular proliferation, when coadministered with a p53 protein. The RTSPs
CC   can be used for treating diseases characterised by abnormal cellular
CC   proliferation, particularly cancers. The RTSPs have a broader spectrum of
CC   activity than wild type RTSPs.

PT   Retinoblastoma suppressor protein with N-terminal modification -
PT   inhibiting cellular proliferation, particularly cancer
PS   Claim 22; Page 150-155; 249pp; English.
CC   This sequence encodes a modified retinoblastoma tumour suppressor
CC   protein (RTSP) of the invention. The proteins can be used for inhibiting
CC   cellular proliferation, when coadministered with a p53 protein. The RTSPs
CC   can be used for treating diseases characterised by abnormal cellular
CC   proliferation, particularly cancers. The RTSPs have a broader spectrum of
CC   activity than wild type RTSPs.

PT   New tetracycline responsive expression vectors - used for the
PT   tightly controlled expression of genes, such as tumour suppressor
PT   genes for treating cancers
PS   Disclosure; Pages 145-150; 190pp; English.
CC   The present sequence appears in the specification, which describes a
CC   tetracycline responsive expression vector (TREV), which contains a
CC   sequence encoding a fusion protein comprising a transcriptional
CC   transactivation domain (TTD) operatively attached to a tetracycline
CC   repressor protein (TRP), the first sequence operatively positioned
CC   downstream of a promoter. The vector also contains a cloning site
CC   operatively positioned downstream of a basal promoter comprising a
CC   tetracycline operator. The TREVs can be used to produce stable cell
CC   lines in which gene expression is tightly regulated by tetracycline.
CC   They can be used for the production of proteins such as tumour
CC   suppressor proteins which can be used for treating diseases characterised
CC   by abnormal cellular proliferation, particularly cancers.

PT New tetracycline responsive expression vectors - used for the
PT tightly controlled expression of genes, such as tumour suppressor
PT genes for treating cancers
PS Disclosure; Pages 153-157; 190pp; English.

CC The present sequence appears in the specification, which describes a
CC tetracycline responsive expression vector (TREV), which contains a
CC sequence encoding a fusion protein comprising a transcriptional
CC transactivation domain (TTD) operatively attached to a tetracycline
CC repressor protein (TRP), the first sequence operatively positioned
CC downstream of a promoter. The vector also contains a cloning site
CC operatively positioned downstream of a basal promoter comprising a
CC tetracycline operator. The TREVs can be used to produce stable cell
CC lines in which gene expression is tightly regulated by tetracycline.
CC They can be used for the production of proteins such as tumour
CC suppressor proteins which can be used for treating diseases characterised
CC by abnormal cellular proliferation, particularly cancers.
